# 接口编辑器调用说明

© 刘阳

#### ParamEditor:

ParamEditor可直接new对象,提供原型方法可由对象调用,例如: var paramEditor = new ParamEditor(); paramEditor.setDom({"key":"value"}, "addApi", "liuyang", onGetJson);

### setDom(data, type, elementId, callback)其中参数:

1, data: 代表接口的定义好格式的json对象, 像:

```
{
    "msg":{
        "desc":"信息",
        "type":"string",
        "required":true,
        "value":"admin",
        "need":false,
        "highlight":false
    }
}
```

2, type: 编辑器的类型,可选类型有:

"addApi":添加接口

"addType":添加接口类型 "checkApi":查看接口 "addData":添加数据 "checkData":查看数据

"compareData": 比较返回数据

- 3, elementId:编辑器将要放置的div节点id
- 4,callback:用户点击保存的回调,回调函数传递改变后的json对象,例如:

var onGetJson = function(changedData){
//do whatever you like

如需一个页面有多个编辑器,只需调用多次setDom并传入不同的elementId字段(无需创建多次ParamEditor对象),例如:

```
var paramEditor = new ParamEditor();
paramEditor.setDom({"key1":"value1"}, "addApi", "divId1", onGetJson);
paramEditor.setDom({"key2":"value2"}, "addApi", "divId2", onGetJson);
```

注: 请确保网页中确实建立了传入elementId对应的div节点 请确定传入的data格式为双方定义好的数据格式,并且为json对象而不是json字符串

## 数据格式的说明:

```
"msg":{
              "desc":"信息",
              "type":"string",
5
6
7
8
              "required":true,
              "value": "admin",
              "need":false,
              "highlight":false
9
          },
10
          "users":{
              "desc":"用户集合",
11
              "type":"jsonArray",
12
13
14
              "required":true,
              "need":true,
15
16
              "highlight":true,
              "child":[
17
                   <u>{</u>
18
                        "userName":{
19
                            "desc":"用户名",
                            "type": "boolean",
20
21
                            "required": false,
22
23
24
                            "need":true,
                            "value": "admin1",
                            "highlight":true
25
26
                        "userType":{
27
                            "desc":"用户类型",
28
                            "type":"number",
29
                            "required":true,
30
                            "value":"教师1",
31
                            "need":true,
32
                            "highlight":false
33
                        }
                   }
34
35
              1
36
          }
37
```

#### 数据基本单元:

"字段名": {

```
"字段描述": "字段描述值",
"字段类型": "字段类型值"(可
为: "string", "int", "long", "float",
"boolean", "jsonArray", "json"),
"是否必填": 必填为true,
"字段值": 除jsonArray,json类型
"是否选中": 编辑查询类型时用
"是否高光": 比较数据时,数据
不同为true
"子元素": 数据类型为
jsonArray,json时用
}
```
